Scotland's bathing water improvements

Classification monitoring results

Scotland's bathing water improvements

Determining pressures - sampling

18 classification samples each season

Sampling input watercourses, transect sampling, microbial source tracking (MST)

Key pressures

- Sewage
- Dogs and gull fouling
- Exacerbated by heavy rain
- Agriculture and private septic tanks not contributors

Water quality improvement actions

- Addressing misconnections
- Sewerage network improvements
- Improvements to Eastfield pumping station
- Addressing litter, gull and dog fouling

Scotland's bathing water improvements

My Beach Your Beach

Funded by Scottish Government and delivered by Keep Scotland Beautiful

Behavior change campaign with posters, bin wraps and advice

On the beach:

Indoors:

Heavy rain

Water quality deteriorates after heavy rainfall, poor water can usually be predicted

Daily water quality predictions and signage, started July 2016

Predictions displayed at the bathing water on electronic signage

Potential bathers can make informed choice on using the water

If we take a high result when poor water quality is predicted, we can remove this from the classification dataset

Improved model developed for 2019

Development and use of modelling techniques for real-time bathing water quality predictions
